US-09-513-999C-32630/c

Sequence 32630, Application US/09513999C

Patent No. 6783961

APPLICANT: Dumas Milne Edwards, J.B.

APPLICANT: Duclert, A.

APPLICANT: Glordano, J.Y.

TILLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.

Patent No. 6783961

FILE REFERENCE: 59.US2.REG

CURRENT FILING DATE: 1090-02-24

PRIOR FILING DATE: 1099-02-26

NUMBER: OF SEQ ID NOS: 36681

SOFTWARE: Patent.pm

SEQ ID NO 32630

LEMCHT: 279
APPLICANT: Ito, Laura Y.

APPLICANT: Sherman, Bradley K.
TITLE OF INVENTION: POLYNUCLEOTIDES AND POLYPEPTIDES DERIVED FROM CORN EAR FILE REPERBNCE: PL-0017 US/09/313,294A
CURRENT FILING DATE: 1999-05-14
NUMBER OF SEQ ID NOS: 7600
SOFTWARE: PERL PROGram
SEQ ID NO 98
LENGTH: 277
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             279

 The CDS has been inserted into proprodon.

The CDS has been inserted into prown a a BP Clonase (TM) reaction. Additional sequence has been added in front of the st. codon: att. .AAAAAA GCA GGC TCC ACC (ATG).

The last codon is followed by the 3' att site: GACCCAGCTTCTT. The clone is validated by full sequence check.

Compared to the reference sequence NM 006835 (GI:1738314) we f. AA exchange (s) at position (first base of changed triplet): 223(arg-sdly) 409(lys-sarg)

Clone distribution: http://www.rzpd.de/products/orfclones/.
 note="Vector: pDONR201, Site_1: attP1; Site_2: attP2"

MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. John D.
Mapping information for Genetics, Washington University, St. Louis
MCPherson, Department of Genetics, Washington University, St. Louis
MCP. For additional information about the map position of this
sequence, see http://genome.wustl.edu/gsc
 The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osocgawa, K., Woon, P.Y., Zhao, B., Frengen, E. Tateno, M., Catanses, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong VECTOR: pBACe3:6
all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >=30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
 The clone sequenced to the left is RP11-123J14, 2000 bp overlap; the clone sequenced to the right is RP11-1E1, 2000 bp overlap. Actual end of this clone is at base position 27847 of RP11-1E1.
 Polymorphisms exist between AC111196 and AC104687

The invention comprises the amino acid and coding sequences of human proteins that are associated with cell growth, differentiation, and death (CGDD). The DNA and protein sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of CGDD, such as: cell proliferative disorders (e.g. arterosclerosis, atherosclerosis, bursitis, cirrhosis, hepatitis, polycythaemia vera, psoriasis and cancers), developmental disorders (e.g. tolshing's syndrome and hypothyroidism), neurological disorders (e.g. Cushing's syndrome and hypothyroidism), neurological disorders (e.g. cirrhosis) attorismuncy disease, parkinson's disease, parkinson's disease and multiple sclerosis), autoimmunc/inflammatory disorders (e.g. AlDS, allergies, anaemia, asthma, contact dermatitis and diabetes mellitus), and reproductive disorders (e.g. infertility, endometriosis and uterine fibroid). The present amino acid sequence represents a human CGDD-associated protein of the

 leukaemia, cervical or breast cancers), immunological disorders (e.g. scleroderma, systemic lupus erythematosus, allergies), gastrointestinal disorders (e.g. Crohn's disease), renal disorders (e.g. Goodpasture's syndrome), infections (e.g. viral, bacterial, fungal, parasitic, protozoal, helminthic), cardiovascular disorders (e.g. atherosclerosis) and hepatic diseases (e.g. cirrhosis). The polynucleotides can be used to create humanised animals or transgenic animals to model human diseases.
 This sequence is human cyclin I. Antisense polynucleotides are useful for as probes and can be labelled and used for detection of neurones by hybridisation with mRNA for cyclin I (contained in the neurones and arising by the expression of the cyclin I gene in these cells). The gene can be used for detection of cancer cells by detecting the expression of the cyclin I gene in these cells. Also antibodies specific for the fragments of the protein (especially AAW21966) can be used for detection

 The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, respection or mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.

 The Invention relates to numen tumour-associated antigenic target (1747) overexpressed in cancer tissues compared to normal tissues, and their related mucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide acids and polypeptides; expression vectors and host cells comprising a TAT nucleic acids, an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, mucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, colorectal cancer, cervical cancer, colorectal cancer, cervical cancer, colorectal cancer, melanoma and leukaemia. TAT nucleic acids may further be nervous system, melanoma and leukaemia. TAT nucleic acids may further be chromosome identification and in gene therapy. The present sequence

the present invention reservables a pulymuciacular (1) compitabiling at sequence of a Bifidobacterium genome selected from the nucleotide sequence given in ABQ81842 and ABQ81843, or a sequence exhibiting at sequences given in ABQ81842 and ABQ81843, also described is a polymucleotide (II) encoding a fusion protein, comprising a sequence selected from 1097 sequences given in ABB65288 to ABB665384 ligated in frame to a polymucleotide encoding a cerivities, and can be used as an inhibitor of Salmonella. (I) (which is a therefologous polypeptide. (I) has antidiarrheic and antibacterial carried bacterium blongum in a biological sample. A carrier containing the Blidobacterium selfidobacterium longum NCC2705 (CNCM I-2618) can be cared for preventing and/or treating diarrhoea brought about by pathogenic bacteria and/or rotavirus. The carrier is a food composition selected from milk, yogurt, curd, cheese, fermented milks, milk based fermented cereal based products, incervients, ice-creams, fermented cereal based products, in the based creaming and/or treating diarrhoea brought about by pathogenic products, infant formula, pet food or a pharmaceutical composition selected from tablets, liquid bacterial suspensions, dried oral carponal pates feeding or wet tube feeding.

(I) is useful in DNA arrays or chips to carry out analysis of the Bifidobacterium related mucleotide sequences given in the Sequence containing a printed appeared invention but not mentioned further within the specification. N.B. The sequence date for this patent is not represented mucleotide sequence information

The invention relates to enhancing silk exsertion in a Zea mays plant under stress, relative to a non-transformed Zea mays plant under stress. The method involves transforming the plant or its ancestor with a construct comprising a silk-specific or silk-preferred promoter operably linked to a polymucleotide encoding a polypeptide that increases cell division. The present sequence represents a Z. mays vacuolar pyrophosphatase, a polypeptide which increases the rate of cell expansion
 Enhancing silk exsertion in a Zea mays plant under stress, relative to non-transformed Zea mays plant under stress by transforming the plant oits ancestor with a construct comprising a silk-specific or silk-

 The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to prowide for expression of a polymocleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant comparison in improved property comprises transformed plant with the such as maize or soybean. The method of producing a transformed plant with the recombinant DNA construct and growing the transformed plant with the polymocleotide or polypeptide is useful for improving plant with the polymocleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, extreme compositions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of carbohydrate, nitrogen or providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved lighin production or improved galactonmannan production. This sequence represents a bacterial polypeptide used in the product of the printed specification but was obtained in electronic format from USPTO at sequence.

a second encoding a cytosolic and/or nuclear localised pyrophosphatase (C-PPass). The present invention describes producing transgenic plants with an increased sucrose content in the root, increased or prolonged meristem activity and/or reduced sucrose degradation during storage. The transgenes isolated from Beta vulgaris (B. vulgaris) are under the control of the cauliflower mosaic virus 35s promoter in separate vectors that were subsequently used to transform the sugar beet plant. This polypeptide sequence is the B. vulgaris vacuolar beta pyrophosphatase (bvpl) protein (V-PPase) of the invention.
 The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as

New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.

Disclosure; Page; 175pp; English.

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infectious by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or inhibit formation of an object or corpusion of an object corpusion of activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify operatial orthologous essential or virulence genes, for scalecting and corpusion of expression patterns, for raising anti-protein antibodies as an an organ to raise anti-DNA antibodies or to elicit another immune corpus or to identify inhibitors of the binding occurs or to identify inhibitors of the binding corpus corpus or to identify inhibitors of the binding corpus host tissues in which pathogenic organism invade or reside, and to lealate correlative receptors or ligands in the case or virulence factors. This sequence represents a protein of one of the essential genes of Aspergillus fumigatus of the invention

Patent No. 6288306;
GENERAL INPORMATION:
APPLICANT: Ward, Eric R
APPLICANT: Volrath, Sandra
TITLE OF INVENTION: Manipulation of Protoporphyrinogen
TITLE OF INVENTION: Oxidase Enzyme Activity in Eukaryotic Organisms
                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                              Length 544;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            55.4%; Score 41; DB 3; Length 544; 58.3%; Pred. No. 1.2e+02;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SOFTWARE: Patentin Release #1.0, Version #1.25

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description
